## **Precision QCD Physics Input to European Strategy Update**

Gavin Salam\* Rudolf Peierls Centre for Theoretical Physics and All Souls College University of Oxford

## Snowmass Energy–Frontier Workshop — Open Questions and New Ideas 21 July 2020, EF01–04 parallel session

\* on leave from CERN TH department and from CNRS (LPTHE)

European Research Council Established by the Europeen Commission

THE ROYAL SOCIETY

## European Particle Physics Strategy Update (EPPSU), 2018 – 2020

- http://europeanstrategyupdate.web.cern.ch/welcome
- ► Major preparatory work on approved and proposed future colliders, e.g.
  - ► <u>Report on the Physics at the HL-LHC, and Perspectives for the HE-LHC</u>
  - ► FCC physics and design reports
- Submitted input: <u>https://indico.cern.ch/event/765096/contributions/</u> (10pp/doc)
- ► <u>Open Symposium</u> (May 2019), including strong interactions <u>session</u> & <u>summary</u>
- ► Physics briefing book: <u>arXiv:1910.11775</u> (strong interactions: section 4)
- ► January 2020: final closed meeting of European Strategy Group
- ► Final strategy <u>document</u> published June 2020

#### two broad roles for QCD

QCD in service of broad particle physics goals (Higgs, EW, DM/BSM, etc.)

#### colliders

#### QCD as a fascinating subject in its own right

- QCD at high energies: weak coupling and asymptotic freedom Perturbative QCD as quantitative framework

  - Dynamics of quarks and gluons

  - Jet observables were early test of QCD • Factorization separates weak from strong coupling effects
- Quantitative predictions
  - Multi-loop calculations for inclusive quantities
  - Higher orders (NLO, NNLO, ...), resummation and parton shower simulation • Strong coupling dynamics parametrized in parton distributions, hadronization

from Thomas Gehrmann's EPPSU talk

- Precision tests of the Standard Model
  - Measurements of masses and couplings
- Interplay of calculations and measurements
  - Accuracy on most cross sections  $\gtrsim 5\%$
  - Limited by PDFs, QCD corrections
- Perturbative QCD as analysis tool
  - Jet substructure techniques
  - Data-driven background predictions

#### from Thomas Gehrmann's EPPSU talk

- QCD at strong coupling: diverse research program
  - Hadron physics, low-energy dynamics, heavy ions

  - Determination of hadron properties
    - Proton radius
    - Form factors
    - Nucleon structure
- Demands and drives new quantitative approaches
  - Understanding non-perturbative dynamics of QCD

from Thomas Gehrmann's EPPSU talk

• Precision spectroscopy of light hadrons  $\leftrightarrow$  lattice QCD at high precision

- Crucial interplay between QCD at strong and at weak coupling
- Non-perturbative effects on precision collider observables
  - Parton distributions
  - Intrinsic transverse momentum
  - Soft underlying event and hadronization
- Hadronic input to SM tests and BSM searches
  - Form factors in flavor physics
  - Hadronic cross sections in neutrino and astroparticle physics
  - Hadronic effects in QED precision observables:  $\alpha(M_7)$ , (g-2).

from Thomas Gehrmann's EPPSU talk

- Feed-in and feed-back between strong and weak coupling QCD
- Example: photon content of the proton (photon PDF)
  - Important ingredient to EW corrections of collider processes
  - Required for precision predictions at highest energies
  - Previously ad-hoc models with large uncertainty
  - LUXqed
    - relate to elastic and inelastic form factors
    - Exploit low-energy data ullet
    - Combine with perturbative QCD evolution
- Different motivation to address similar questions

from Thomas Gehrmann's EPPSU talk

1607.04266

# to maximally exploit HL-LHC

#### **QCD** theory is workhorse of LHC experiments

### Need for precision @ HL-LHC

- Illustrated in the case of Higgs physics
- theory uncertainty (PDF + strong coupling + missing higher orders) dominates in 7/9 channels
- this is with the assumption of reduction by x2 in today's theory uncertainties
- depending on channel, it can be the uncertainties for the signal or the background that dominates.

**Figure 1.** Projected uncertainties on  $\kappa_i$ , combining ATLAS and CMS: total (grey box), statistical (blue), experimental (green) and theory (red). From Ref. [2].

## gluon fusion Higgs theory uncertainties

Fig. 1: The figure shows the linear sum of the different sources of relative uncertainties as a function of the collider energy. Each coloured band represents the size of one particular source of uncertainty as described in the text. The component  $\delta(PDF + \alpha_S)$  corresponds to the uncertainties due to our imprecise knowledge of the strong coupling constant and of parton distribution functions combined in quadrature.

## **QCD** theory anticipated / needed for full exploitation of HL-LHC

#### (1) Fixed-order / resummed calculations

- ► Core processes at high accuracy  $(2 \rightarrow 1 \text{ and } 2 \rightarrow 2)$ : 1%, N3LO
- Splitting functions at N3LO (also needed for potential ep machines)
- Complex processes at few percent accuracy
- Accuracy at high p<sub>T</sub>
- Technical requirements for NLO multi-particle precision
- Multi-variate analyses / observables: performance and uncertainties
- Non-perturbative effects
- ► Resummation (incl. SCET)
- Accurate predictions for BSM effects

## **QCD** theory anticipated / needed for full exploitation of HL-LHC

#### (2) General purpose Monte Carlo event-generator tools

- > Perturbative improvements for Matching and Merging (e.g. generalisation of approaches for parton shower + NNLO merging,)
- Understanding & exploiting relation between parton-shower algorithms and resummation
- > Phenomenological Models (hadronisation, underlying event, also connects with HI physics, neutrino programmes, low energy QCD, various "beyond colliders" experiments, cosmic-ray physics)

## projected improvements in PDFs & strong coupling

- plot illustrates use of pseudodata with HL-LHC stats to obtain estimates of expected PDF uncertainties at HL-LHC
- > PDF extractions will need to move to N3LO once available
- strong coupling remains contentious
  - tensions between different groups' extractions (PDFs, event shapes, and to a lesser extent lattice QCD)
  - ► what ultimate accuracy on 10-15 year timescale?

#### Projected invariant tī mass data

# to maximally exploit proposed future colliders (ee, eh, hh)

#### future e+e- colliders

- > precision for decays, e.g. in Higgs physics and top-quark physics
- physics

	$\delta\Gamma_Z \;[{ m MeV}]$	$\delta R_l \ [10^{-4}]$	$\delta R_b \ [10^{-5}]$	$\delta \sin^{2,l}_{eff} \theta \ [10^{-6}]$			
Present EWPO theoretical uncertainties							
EXP-2018	2.3	250	66	160			
TH-2018	0.4	60	10	45			
EWPO theoretical uncertainties when FCC-ee will start							
EXP-FCC-ee	0.1	10	$2\div 6$	6			
TH-FCC-ee	0.07	7	3	7			

Table 1: Comparison for selected precision observables of present experimental measurements (EXP-2018), current theory errors (TH-2018), FCC-ee precision goals at the end of the Tera-Z run (EXP-FCC-ee) and rough estimates of the theory errors assuming that electroweak 3-loop corrections and the dominant 4-loop EW-QCD corrections are available at the start of FCC-ee (TH-FCC-ee). Based on discussion in [2].

> 3-loop and partial 4-loop calculations of Zff vertex for Tera-Z for EW pseudo-observables

new generations of MC programs for QED and EW effects, understanding two-photon

#### future pp colliders

- combination of higher energies and luminosities will continue to push potential for precision
- ➤ need for precision will extend to high transverse momenta → requires improved treatment of EW corrections, including mixed QCD-EW effects
- ➤ very high-multiplicity final states, possibly involving multiple scales → needs understanding of regions of validity of perturbation theory, interplay with parton showers, etc., including for EW objects

S  $0.2 \qquad 0.2 \qquad 100 \text{ TeV} \qquad 100 \text{ TeV} \qquad 0.1 \qquad \sigma = \sigma(p_T^{\text{jet}} > p_{T,\min}), |\eta_j| < 2.5 \qquad 100 \qquad 1000 \qquad 100 \qquad$ 

#### 12 19

#### PDFs: Still work to do for FCC...

#### Still large PDF uncertainties in pp at 100 TeV in key (x,Q<sup>2</sup>) regions:

10<sup>5</sup> Plot by J. Rojo, Dec 2013 **NEW PHYSICS** FCC 100 TeV 10<sup>4</sup> 2 TeV squarks LHC 14 TeV  $M_{\chi}$  ( GeV ) PRECISION 10<sup>3</sup> **PHYSICS** Higgs, top 10<sup>2</sup> E W,Z LOW-X **PHYSICS** 10 y=0 \_ y=4 ,∕ **10**<sup>-10</sup> 10<sup>13</sup> 101 10<sup>-:</sup> 104 10 FCC-ep required to reach O(1%) uncertainty for  $\sigma(W,Z,H)$  at FCC-pp

Strong Interactions, EPPS Update, May'19

David d'Enterria (CERN)

18/27

#### The ep Physics at the Energy Frontier

and unfold hadron sub-structure for LHC and FCC-hh unambiguously

 $Q^2 \, / \, GeV^2$ LHeC Experiment:  $10^{6}$ XXX. HERA Experiments: balo<sup>5</sup> sduared H1 and ZEUS Fixed Target Experiments: NMC 4 10 BCDMS 10 10 10 -cc-eh E665 SLAC 3 LHec -four-momentum 10 2 High Density Matter Saturation? New form of gluonic matter? small x for UHE resummation of multiple scattering Neutrinos & FCC-hh 10-4 10<sup>-5</sup> 10 10

from Uta Klein's EPPSU talk

New ep colliders beyond HERA c.m.s.

Extensions of both x and Q<sup>2</sup> ranges are crucial for pp experiments and HEP theory developments;

HERA established the validity of pQCD down to x > 10<sup>-4</sup> (DGLAP) due to a very high lever arm in Q<sup>2</sup>:

→ high luminosity
 colliders
 with high c.m.s.
 energy of
 1.3 – 3.5 TeV

Exploit FCC-ee H(gg) as a "pure gluon" factory:  $H \rightarrow gg$  (BR~8% accurately known) provides O(100.000) extra-clean digluon events.

- Gluon vs. quark via  $H \rightarrow gg$  vs.  $Z \rightarrow qq$ (Profit from excellent g,b separation)
- Gluon vs. quark via  $Z \rightarrow bbg vs. Z \rightarrow qq(g)$ (g in one hemisphere recoiling against 2-b-jets in the other).
- ♦ Vary E<sub>iet</sub> range via ISR:  $e^+e^- → Z^*, \gamma^* → jj(\gamma)$
- Vary jet radius: small-R down to calo resolution
- Multiple high-precision analyses at hand: – <u>BSM</u>: Improve q/g/Q discrimination tools

  - <u>pQCD</u>: Check N<sup>n</sup>LO antenna functions. High-precision QCD coupling. – <u>non-pQCD</u>: Gluon fragmentation: Octet neutralization? (zero-charge gluon) jet with rap gaps). Colour reconnection? Glueballs ? Leading η's, baryons?

Strong Interactions, EPPS Update, May'19

from David d'Enterria's EPPSU talk

#### High-precision gluon & quark jet studies (FCC-ee)

- Multiple handles to study gluon radiation & g-jet properties:

 $Z(l^+l^-)+H(gg)$ 

from David d'Enterria's EPPSU talk

#### Highly-boosted jets, multijets (FCC-pp)

- Proton-proton collisions at 100 TeV provide unique conditions to produce & study highly-boosted objects: top, W, Z, H, R<sub>BSM</sub>(jj),... Resolving small angular dijet sep.  $\Delta R \approx 2M(jj)/p_{\tau}(j)$ .
- Jet substructure: key to separate dijets from QCD & (un)coloured resonance decays, e.g. top jets, m<sub>z</sub> = 10 TeV

quark vs. gluon jets (& jet radius).

22/27

Strong Interactions, EPPS Update, May'19

David d'Enterria (CERN)

# resources & the next generation

#### incoming / early-stage researchers and subsequent career development

- neither with glory nor even necessarily papers)
- In how do we ensure recognition for early-stage researchers working within the medium-sized teams (O(10) researchers) that are increasingly common?
- specialisation v. broad training
  - pheno applications -> individuals specialise
  - with broad physics ability within the field

> early-stage researchers need recognition for a variety of types of contribution (e.g. including the technical work that simply "makes things work" but that comes

successful projects need skills that span interface with maths (incl. computer algebra), interface with computing, machine-learning, and a range of physics/

> at same time we need to ensure future generation can combine specific expertise

#### issues of long-term support

- funding for projects that last longer than typical funding cycles support for codes:
  - time, which can be a substantial burden

  - who do this well, e.g. in terms of career recognition)
- computing aspects
  - adapting codes to new architectures

  - best to share nationally and internationally?

state-of-the-art physics codes often developed in small groups, but subsequent long-term maintenance & user-support of successful codes often requires substantial dedicated expert

► the "glue" codes (e.g. LHAPDF, HepMC): may not be seen as physics by funding agencies, but support (people/resources) & evolution essential for long-term smooth operation of the field "mechanisms need to be developed to share the effort between event generator projects and their user communities" [Id114] (& we need to ensure that conditions are attractive for those

> availability of state-of-the-art hardware (e.g. hundreds of GPUs, very high-memory machines) > many university groups can't afford to keep up with disparate landscape of hardware. How

#### **QCD theory summary**

- Advances in QCD theory are essential to e built into some projections!)
- They will involve a wide range of topics, spanning calculations of amplitudes to Monte Carlo event generations, including phenomenological work to connect with data
- Theory advances can bring light also on many topics of intrinsic interest in QCD, including proton structure, exotic hadrons, connections with "theorists's theories" like N=4 SUSY
- Continued support of QCD theory is essential for success of European collider programme, and community needs to keep in mind
  - recognition of contributions of early-stage researchers as teams grow larger
  - funding structure for increasingly long-term theory projects
  - positions and career development for individuals who provide essential "support" roles (maintenance of widely used tools, interfacing with & support for users, ...)
  - computing (access to hardware and expertise)

## gluon fusion Higgs theory uncertainties

Fig. 1: The figure shows the linear sum of the different sources of relative uncertainties as a function of the collider energy. Each coloured band represents the size of one particular source of uncertainty as described in the text. The component  $\delta(PDF + \alpha_S)$  corresponds to the uncertainties due to our imprecise knowledge of the strong coupling constant and of parton distribution functions combined in quadrature.
